Introduction: How to Use This Book

Things should be made as simple as possible, but not any simpler.

— Albert Einstein

Who is this book for?

This book is designed to help non-native speakers of English write science research papers for publication in English. However, it can also be used as a guide for native English speakers who would like support with their science writing, and by science students who need to write a Master's dissertation or PhD thesis. It is a practical, rather than a theoretical book, and is intended as a fast do-it-yourself manual for researchers and scientists.

The book is aimed at those whose English language ability is at intermediate level or above. If you have taken an IELTS test, this is equivalent to a score of above 6.0; if you have taken a TOEFL test then this is approximately equivalent to a score above 550 (paper-based test) or 91 (iBT). However, if you have managed to read this far without using a dictionary, you will be able to use this book, even if you don't understand every word.

Why do I need it?

The goal of scientific research is publication, but good scientists are not always good writers and even native speakers of English sometimes have difficulty when they write up their research. The aim of this book is to give you the information, vocabulary and skills you need quickly and easily so that you can write confidently using the style and structure you see in the journals you read.

As a science researcher, you are able to read and understand complex, high-level material in your field. However, you may find it difficult to produce written English which is at the same level as your reading. You may feel that your English writing does not represent the content of your work effectively or accurately. The aim of this book is to enable you to use your reading ability and the material you read to develop the writing skills your work requires.

Developing the skills to write up your own research is the only way to join the international science community. If you depend on English speakers to translate your writing, their translation may not represent exactly what you intended. If you depend on proofreaders to correct your English they may not notice some errors, because a sentence which is grammatically correct is still 'wrong' if it does not mean what you intended. Also, a proofreader may not check whether your writing fits the conventional 'science research' patterns. For example, you may have forgotten to justify your choice of method or explain how your results relate to your original question, and this could mean that an editor of a science journal rejects your paper as unprofessional.

Writing and publishing a research paper is the best way to get your career off the ground. If you can turn your thesis or research project into a useful paper, your CV (Curriculum Vitae) will immediately look more professional and will be more competitive internationally. You may feel that you don't have the time to improve your English, but you already know most of what you need from the reading you have done over the years. In order to write up your research for publication you don't need to learn much more English than you already know. **Science writing is much easier than it looks.**

Most science research is written according to a fairly conventional structure: first the *title*, then the *abstract*, followed by an *introduction*, after which there is a *central section* which describes what was done and what was found and then a *discussion and/or conclusion*. At the end of the paper or research article, acknowledgements and references are added. This means that the structure of a research article will be quite similar for all writers.

Because science writing is so conventional, the amount of grammar and vocabulary you need to learn is quite small. For example, the non-technical vocabulary used in scientific writing consists of a limited set of

words such as *attempt, conduct, interpret, evaluate, determine, implement, formulate, classify, correlate, enhance*, which are used as a kind of ‘code’. All the vocabulary you need to get started (apart from the specialised vocabulary of your field) is in this book.

What will this book teach me?

The book will show you how to discover the conventions of structure, organisation, grammar and vocabulary in science writing in your field and will provide you with the tools to write in a similar way and at a similar level. It will teach you how to turn your research into a paper that can be submitted to a professional journal. You will also be able to use most of the information in the book and all of the language and vocabulary if you are writing a thesis in English.

I have been teaching English for Academic Purposes to science students for over 30 years. For the past 15 years I have been teaching research writing in the English Language Support Programme at Imperial College, London, where I also work closely with individual research students and staff who are writing a paper or thesis. This book is based on the most useful thing I have learned: when your language skills are not perfect, organising your information in a conventional way and using conventional language are very important. If you write according to a conventional model, the reader knows what you are trying to do because the model you are following is familiar, and language errors are therefore less significant. A researcher who begins by writing according to a simple and conventional model will soon develop higher level skills for writing independently and professionally. The opposite is also true: researchers who do not begin by writing according to a conventional model are less likely to develop these skills.

How does the book work?

The strategy in this book can be summed up as follows: carefully examine good examples of the kind of writing you would like to produce, identify and master the structure, grammar and vocabulary you see in these examples and then apply them in your own writing.

The book is divided into five units, each dealing with one section of a research article. Unit 1 deals with the Introduction, Unit 2 the Methodology, Unit 3 the Results, Unit 4 the Discussion or Conclusion and Unit 5 the

Abstract and Title. Since the aim of this book is to enable you to write in a conventional way, each unit is designed to help you discover what the conventional model of that section of a research article looks like. In each unit you will also be given support on the grammar and writing skills needed to write that section of the research article and you will be guided towards the appropriate vocabulary.

Each unit is similar. The unit on Introductions, for example, begins by looking at a sample research article Introduction similar to those in science journals, then there is a Grammar and Writing Skills section designed to respond to frequently asked questions. Because you are probably working hard on your research and don't have time to do much grammar work, there are very few grammar exercises in the Grammar and Writing Skills sections. In any case, getting the answer right in a grammar exercise doesn't automatically mean you will produce the correct grammar when you write about complex topics. Answering correctly can give you a false sense of confidence and security.

After the Grammar and Writing Skills section you will create a model or template for writing Introductions using the sample Introduction, and this is followed by a detailed Key providing model descriptors, discussion and answers to questions. The unit includes extracts from real Introductions so that you can test the model and see how it works in the 'real world'. These extracts are then used to find the vocabulary which will help you operate the model successfully. This is followed by a complete list of useful vocabulary together with examples of how the words and phrases are used.

At this stage, you will have a robust model of an Introduction, a grammar guide to deal with possible problems and a list of useful vocabulary to make the model work. Towards the end of the unit, you will be ready to test what you have learned by writing an Introduction. If you have done the tasks, you should be able to put the model, the grammar/writing skills and the vocabulary together, and a perfect Introduction will write itself almost automatically! So at the end of the unit on Introductions, you will try out what you have learned: you will write an Introduction using the model and the vocabulary list and then compare it with a sample answer in the Key.

This pattern is repeated in the rest of the units. Ideally, you should work through the book and do each task. If you read the book without completing the tasks you will have an intellectual understanding of what to do but you may find it harder to put it into practice.

Do I need any other material or books?

No, but before you begin, you should collect three or four recent research papers in your field from the journals you usually read and photocopy them. You will use these as target articles to help you adapt what you learn here to your own work, and you will refer to them while reading this book to see how the things you are learning are done in your research field. Don't use chapters from books as target articles; they are not written according to the same conventional structure as research papers and so will not help you discover how a research paper or thesis in your field is written.

Your target research articles should:

- be written by a researcher/research team based at an English-speaking institution, ideally a native speaker of English.
- be reasonably short (less than 15 A4 sides including graphs and tables).
- deal with subject matter which is as close as possible to your own topic and the kind of research you are doing.
- have clearly defined Introduction, Methodology, Results and Discussion/ Conclusion sections. It will help you if these are subtitled so that you can locate them easily. Note that the subtitles may vary in different fields and even in different journals in each field; for example the Methodology can be called 'Procedure', 'Materials and Methods', 'Experimental' or some other variation.

Contents

Introduction: How to Use This Book	v
Unit 1: How to Write an Introduction	
1.1 Structure	1
1.2 Grammar and Writing Skills	4
1.2.1 Tense pairs	4
1.2.2 Signalling language	7
1.2.3 Passive/Active	11
1.3 Writing Task: Build a Model	15
1.3.1 Building a model	15
1.3.2 Key	17
1.3.3 The model	24
1.3.4 Testing the Model	25
1.4 Vocabulary	32
1.4.1 Vocabulary for the Introduction	34
1.5 Writing an Introduction	41
1.5.1 Write an Introduction	41
1.5.2 Key	42
Unit 2: Writing about Methodology	
2.1 Structure	44
2.2 Grammar and Writing Skills	46
2.2.1 Passives and tense pairs	47
2.2.2 Use of 'a' and 'the'	50
2.2.3 Adverbs and adverb location	56
2.3 Writing Task: Build a Model	57
2.3.1 Building a model	57
2.3.2 Key	59

2.3.3 The model	66
2.3.4 Testing the model	67
2.4 Vocabulary	75
2.4.1 Vocabulary task	76
2.4.2 Vocabulary for the Methodology section	77
2.5 Writing a Methodology Section	88
2.5.1 Write a Methodology section	88
2.5.2 Key	90
Unit 3: Writing about Results	
3.1 Structure	91
3.2 Grammar and Writing Skills	94
3.2.1 Sequence	94
3.2.2 Frequency	99
3.2.3 Quantity	102
3.2.4 Causality	108
3.3 Writing Task: Build a Model	111
3.3.1 Building a model	111
3.3.2 Key	113
3.3.3 The model	122
3.3.4 Testing the model	124
3.4 Vocabulary	135
3.4.1 Vocabulary task	136
3.4.2 Vocabulary for the Results section	137
3.5 Writing a Results Section	149
3.5.1 Write a Results section	150
3.5.2 Key	151
Unit 4: Writing the Discussion/Conclusion	
4.1 Structure	154
4.2 Grammar and Writing Skills	158
4.3 Writing Task: Build a Model	167
4.3.1 Building a model	167
4.3.2 Key	170
4.3.3 The model	179
4.3.4 Testing the model	180

4.4 Vocabulary	186
4.4.1 Vocabulary task	187
4.4.2 Vocabulary for the Discussion/Conclusion	187
4.5 Writing a Discussion/Conclusion	193
4.5.1 Write a Discussion/Conclusion	194
Unit 5: Writing the Abstract	
5.1 Structure	197
5.2 Grammar and Writing Skills	201
5.2.1 Verb tense	201
5.2.2 Length	204
5.2.3 Language	204
5.3 Writing Task: Build a Model	205
5.3.1 Building a model	205
5.3.2 Key	206
5.3.3 The models	212
5.3.4 Testing the models	213
5.4 Vocabulary	216
5.4.1 Vocabulary task	217
5.4.2 Vocabulary for the Abstract	217
5.5 Writing an Abstract	221
5.5.1 Write an Abstract	221
5.5.2 Key	224
5.6 Creating a Title	224
Sources and Credits	229
