PREFACE

A project on “Biomechanics at Micro- and Nanoscale Levels,” the title of this book, was approved by the Ministry of Education, Culture, Sports, Science and Technology of Japan in 2003, and this four-year-project is now being carried out by fourteen prominent Japanese researchers. The project consists of four fields of research, which are equivalent to four chapters of this book, namely, Cell Mechanics, Cell Response to Mechanical Stimulation, Tissue Engineering, and Computational Biomechanics.

Our project can be summarized as follows. The essential diversity of phenomena in living organisms is controlled not by genes but rather by the interaction between the micro- or nanoscale structures in cells and the genetic code, the dynamic interaction between them being especially important. Therefore, if the relationship between the dynamic environment of cells and tissues and their function can be elucidated, it is highly possible to find a method by which the structure and function of such cells and tissues can be regulated. The first goal of this research is to understand dynamic phenomena at cellular and biopolymer-organelle levels on the basis of mechanics. An attempt will then be made to apply this understanding to the development of procedures for designing and producing artificial materials and technology for producing or regenerating the structure and function of living organisms.

We are planning to publish a series of books related to this project, this book being the first in the series. The trend and level of research in this area in Japan can be understood by reading this book.

CONTENTS

PREFACE	v
I. CELL MECHANICS	1
Imaging and mechanical properties of guinea pig outer hair cells studied by atomic force microscopy <i>H. Wada, M. Sugawara, K. Kimura, Y. Ishida, T. Gomi, M. Murakoshi, Y. Katori, S. Kakehata, K. Ikeda and T. Kobayashi</i>	3
Development of a novel micro tensile tester for single isolated cells and its application to viscoelastic analysis of aortic smooth muscle cells <i>T. Matsumoto, J. Sato, M. Yamamoto and M. Sato</i>	16
Shear dependent albumin uptake in cultured endothelial cells <i>K. Tanishita, M. Shimomura, A. Ueda, M. Ikeda and S. Kudo</i>	26
Biomechanical and biotribological importance of surface and surface zone in articular cartilage <i>T. Murakami, Y. Sawae, N. Sakai and I. Ishikawa</i>	42
II. CELL RESPONSE TO MECHANICAL STIMULATION	53
Osteoblastic mechanosensitivity to localized mechanical stimulus depends on orientation of cytoskeletal actin fibers <i>T. Adachi and K. Sato</i>	55
Microbiomechanical properties of cultured endothelial cells estimated by atomic force microscopy <i>M. Sato</i>	65
Effects of mechanical stresses on the migrating behavior of endothelial cells <i>T. Tanaka, K. Naruse and M. Sokabe</i>	75

III. TISSUE ENGINEERING	89
Engineering approaches to regulate cell differentiation and tissue regeneration <i>T. Ushida, K. S. Furukawa, G. Chen and T. Tateishi</i>	91
A new theory on the localization of vascular diseases <i>T. Karino, S. Wada and T. Naiki</i>	100
Automorphogenesis of load bearing fibrous tissues: Generation of tensile stress, cell alignment, and matrix deformation by fibroblasts <i>K. Takakuda</i>	113
IV. COMPUTATIONAL BIOMECHANICS	123
Note on anisotropic properties of cancellous bone and trabeculae: Elasticity and hardness <i>M. Tanaka, T. Matsumoto, M. Ihara and M. Todoh</i>	125
Application of computational biomechanics to clinical cardiovascular medicine <i>T. Yamaguchi</i>	134
Biomechanical study for skeletal muscle injury and a view of micro-biomechanics for microstructure of muscle <i>S. Yamamoto and E. Tanaka</i>	144
Mechanical behavior and structural changes of cells subjected to mechanical stimuli: Deformation, freezing, and shock waves <i>H. Yamada, H. Ishiguro and M. Tamagawa</i>	154
SUBJECT INDEX	165
