K. Kaneko, *University of Tokyo, Japan*

Ph. Maini, *Oxford University, UK*

AIMS AND SCOPE

The aim of this new interdisciplinary series is to promote the exchange of information between scientists working in different fields, who are involved in the study of complex systems, and to foster education and training of young scientists entering this rapidly developing research area.

The scope of the series is broad and will include: Statistical physics of large nonequilibrium systems; problems of nonlinear pattern formation in chemistry; complex organization of intracellular processes and biochemical networks of a living cell; various aspects of cell-to-cell communication; behaviour of bacterial colonies; neural networks; functioning and organization of animal populations and large ecological systems; modeling complex social phenomena; applications of statistical mechanics to studies of economics and financial markets; multi-agent robotics and collective intelligence; the emergence and evolution of large-scale communication networks; general mathematical studies of complex cooperative behaviour in large systems.

PREFACE

This book is devoted to a discussion of analogies and differences of complex production systems – natural, as in biological cells, or man-made, as in economic systems or industrial production. Hierarchical models of industrial supply chains are characterized by systems of differential equations closely related to traffic flow models. Interesting questions asked in this context go much beyond the static network analysis. Since most production systems are highly stochastic and event-driven, they are rarely, if ever, at equilibrium. Hence the reaction of a given supply network to specific events as well as its transient response to parameter changes and control actions has to be understood through simulation as well as through fundamental models. Additionally, these dynamic responses are constrained by economics, leading to the evolution of systems with higher productivity and profitability. On the other hand, recent research has put forward a view of a biological cell as a factory where products of one machine are used by other machines for manufacturing of their own products or for regulation of their functions. In some cases, a cell may operate in a synchronous mode, so that the operation cycles of individual machines are temporally correlated and the intermediate parts are released exactly when they are needed for further production by other machines. A special property of biological production networks is that, to a large extent, their activity is self-organized and persists despite the presence of strong thermal fluctuations. Progress in micro- and nanotechnology may soon bring about a possibility to produce nanorobots and to design self-reproducing artificial cells, leading to a revolution in industrial manufacturing. However, the principles of purposeful operation of large ensembles of nanodevices and populations of artificial cells should first be investigated. Obviously, they again should bear strong similarities to biological organization. The common themes of industrial and biological production include evolution and optimization, synchronization and self-organization, robust operation despite high stochasticity, and hierarchical dynamics.

The book presents selected lectures given at the international workshop “Networks of Interacting Machines: Industrial Production Systems and Biological Cells” (Berlin, December 2003), organized with the financial support of the Klaus Tschira Foundation. Its authors are a group of scientists and industrialists from Europe, Japan and USA. Together, we hope to provide an overview of modern perspectives on principles of production organization. We are grateful to the Tschira Foundation for providing financial support and thank Dr. Oliver Rudzick for his assistance in the preparation of manuscripts.

CONTENTS

<i>Preface</i>	v
1 Continuum Models for Interacting Machines	1
<i>Dieter Armbruster, Pierre Degond, Christian Ringhofer</i>	
1.1 Introduction	2
1.2 Heuristic Models	5
1.2.1 Quasistatic Models	5
1.2.2 Advection-Diffusion Equations	8
1.2.3 Policies and Bottlenecks	11
1.2.3.1 Dispatch Rules	11
1.2.3.2 Bottlenecks and Maximal Capacities	12
1.3 First Principle Models	13
1.3.1 Kinetic Models	13
1.3.2 Deterministic Kinetic Models	14
1.3.3 Stochasticity and Diffusion	21
1.4 Conclusions	29
References	31
2 Supply and Production Networks: From the Bull-	
whip Effect to Business Cycles	33
<i>Dirk Helbing, Stefan Lämmer</i>	
2.1 Introduction	34
2.2 Input-Output Model of Supply Networks	35
2.2.1 Adaptation of Production Speeds	36
2.2.2 Modelling Sequential Supply Chains	37
2.2.3 More Detailed Derivation of the Production Dynamics	39
2.2.4 Dynamic Solution and Resonance Effects	40
2.2.5 The Bullwhip Effect	41

2.3	Network Effects	43
2.3.1	General Methods of Solution	44
2.3.2	Examples of Supply Networks	47
2.4	Network-Induced Business Cycles	51
2.4.1	Treating Producers Analogous to Consumers	53
2.5	Reproduction of Some Empirically Observed Features of Business Cycles	54
2.5.1	Dynamic Behaviors and Stability Thresholds	55
2.6	Summary	59
2.7	Future Research Directions	60
2.7.1	Network Engineering	60
2.7.2	Cyclic Dynamics in Biological Systems	60
2.7.3	Heterogeneity in Production Networks	61
2.7.4	Multi-Goal Control	61
2.7.5	Non-Linear Dynamics and Scarcity of Resources	61
	Appendix A.	63
2.8	Boundary between Damped and Growing Oscillations	63
2.9	Boundary between Damped Oscillations and Overdamped Behavior	64
	References	64
3	Managing Supply-Demand Networks in Semiconductor Manufacturing	67
	<i>Karl Kempf</i>	
3.1	Introduction to Supply-Demand Networks	67
3.2	Examples from the Semiconductor Manufacturing	69
3.2.1	A Product-Centric Perspective	70
3.2.2	A Facilities-Centric Perspective	71
3.2.3	Repetitive Decisions	72
3.2.4	Combinatorial Complexity	73
3.2.5	Complexity from Supply Stochasticity	73
3.2.6	Complexity from Demand Stochasticity	74
3.2.7	Complexity from Nonlinearity	75
3.2.8	Financial Complexity	75
3.3	Managing Supply-Demand Networks	76
3.3.1	A Capacity Planning Formulation	77

3.3.2	An Inventory Planning Formulation	82
3.3.3	Integrating Capacity and Inventory Planning	86
3.3.4	A Tactical Execution Formulation	88
3.3.5	Simulation Support	94
3.4	Conclusions	97
	References	98

4 Modelling Manufacturing Systems for Control: A Validation Study 101

Erjen Lefeber, Roel van den Berg, J.E. Rooda

4.1	Introduction	101
4.2	Preliminaries	102
4.3	Effective Process Times (EPT's)	105
4.4	Control Framework	108
4.4.1	Approximation Model	109
4.4.2	Model Predictive Control (MPC)	110
4.4.3	Control Framework (revisited)	111
4.5	Modelling Manufacturing Systems	113
4.6	Validation of PDE-Models	115
4.6.1	Manufacturing Systems	116
4.6.2	PDE-Models	117
4.6.3	Validation Study	118
4.7	Concluding Remarks	122
