Preface

Knot theory is a new and rich field of mathematics. Although “real” knots are familiar to everyone and many ideas in knot theory can be formulated in everyday language, it is an area abundant with open questions.

One of the main ideas of this book is to avoid obvious classification of knots and links according to their number of components. For this reason knots and links are referred to as *KLs* and treated together whenever possible.

KLs are denoted by Conway symbols, a geometrical-combinatorial way to describe and derive *KLs*. The same notation is used in the *Mathematica* based computer program *LinKnot* that represents an integral part of this book. *LinKnot* is not only a supplementary computer program, but the best and most efficient tool for obtaining almost all of the results presented in the book, that belong to the field of *experimental mathematics*.

Hands-on computations using *Mathematica* or the *webMathematica* package *LinKnot* along with detailed illustrations facilitate better learning and understanding. The program *LinKnot* can be downloaded from the web address <http://www.mi.sanu.ac.yu/vismath/linknot/> and used as a powerful educational and research tool for experimental mathematics—implementation of Caudron’s ideas and the Conway notation enables working with large families of knots and links. The electronic version of this book and the program *LinKnot* that provides *webMathematica* on-line computations are available at the address <http://math.ict.edu.yu/>.

Each knot theory problem described in this book is accompanied with the corresponding *LinKnot* function that enables the reader to actively use the program *LinKnot*, not only for illustrating some problems, but for computations and experimentation. *LinKnot* is software open to future development: a reader can change it or add new functions. For the systematic

and exhaustive derivation of KL s we have accepted the concept proposed by J.H. Conway and A. Caudron, supported and used in a form adapted for computer implementation. As a prerequisite for the use of the Conway notation, the complete list of basic polyhedra up to 20 crossings is given in the program *LinKnot*.

The key idea is the “vertical” classification of KL s into well-defined categories—worlds, subworlds, classes, and *families*, according to new sets of recursively computed invariants. Patterns obtained from computing KL invariants imply the existence of more general KL family invariants that agree with all proposed conjectures. We strongly believe that the concept of family invariants will be placed on a firm theoretical foundation in the future. New KL tables, organized according to KL families, are given in Appendix A that can be downloaded from the address <http://www.mi.sanu.ac.yu/vismath/Appendix.pdf>.

After a short graph-theoretical introduction, we consider different notations for KL s: Gauss, Dowker, and Conway notation, along with their advantages and disadvantages. All basic KL invariants such as the minimum crossing number, minimum writhe, linking number, unknotting or unlinking number, cutting number, and KL properties such as chirality, periodicity, unlinking gap, and braid family representatives of KL s are discussed in Chapter 1.

In Chapter 2 we address two important problems: recognition and generation of KL s. As recognition criteria we consider KL colorings, KL groups, and more powerful tools such as polynomial KL invariants. Again, we try to show that polynomial KL invariants can be recovered from the Conway notation and recursively computed for KL families.

Chapter 3 contains a short excursion into the history of knot theory and places an emphasis on the beauty, universality, and diversity of knot theory through various non-standard applications such as mirror curves, fullerenes, self-referential systems, and KL automata.

We wish to thank Wolfram Research and ICT for supporting our project, Professors Mitsuyuki Ochiai and Noriko Imafujii for their cooperation in the development of the program *LinKnot* and joint distribution of *LinKnot* and *Knot2000* ($K2K$), Dror Bar Natan for joining program *LinKnot* with *Mathematica* package *KnotTheory*, and Professors Donald Crowe, Louis Kauffman, Jay Kappraff, Charles Livingston, Jozef Przytycki, and Thomas Gittings for their advice and suggestions.

Contents

<i>Preface</i>	v
1. Notation of Knots and Links	1
1.1 Basic graph theory	1
1.2 Shadows of <i>KLs</i>	10
1.2.1 Gauss and Dowker code	16
1.3 <i>KL</i> diagrams	25
1.4 Reidemeister moves	40
1.5 Conway notation	50
1.6 Classification of <i>KLs</i>	59
1.7 <i>LinKnot</i> functions and <i>KL</i> notation	66
1.8 Rational world and <i>KL</i> invariants	69
1.8.1 Chirality of rational <i>KLs</i>	77
1.9 Unlinking number and unlinking gap	81
1.10 Prime and composite <i>KLs</i>	119
1.11 Non-invertible <i>KLs</i>	125
1.11.1 Tangle types	131
1.11.2 Non-invertible pretzel knots	136
1.11.3 Non-invertible arborescent knots	140
1.11.4 Non-invertible polyhedral knots	142
1.12 Reduction of <i>R</i> -tangles	145
1.12.1 <i>KLs</i> with unlinking number one	148
1.13 Braids	157
1.13.1 <i>KLs</i> and braids	161
1.14 Braid family representatives	165
1.14.1 Applications of minimum braids and braid family representatives	179

1.15	More KL invariants	182
1.16	Borromean links	187
2.	Recognition and Generation of Knots and Links	195
2.1	Recognition of KL s	195
2.1.1	Group of KL	201
2.2	Polynomial invariants	207
2.3	Vassiliev invariants	219
2.4	Experimenting with KL s	225
2.5	Derivation and classification of KL s	227
2.6	Basic polyhedra and polyhedral KL s	241
2.7	Basic polyhedra and non-algebraic tangles	268
2.7.1	Generalized tangles	282
2.7.2	n -tangles and basic polyhedra	283
2.7.3	Non-algebraic tangle compositions and component algebra	295
2.8	KL tables	303
2.8.1	Non-alternating and almost alternating KL s	307
2.9	Projections of KL s and chirality	311
2.10	Families of undetectable KL s	341
2.10.1	Detecting chirality of KL s by polynomial invariants	356
2.11	A dream— new KL tables	363
3.	History of Knot Theory and Applications of Knots and Links	375
3.1	History of knot theory	375
3.2	Mirror curves	383
3.2.1	Tamil treshold designs	384
3.2.2	Tchokwe sand drawings	385
3.2.3	Construction of mirror curves	388
3.2.4	Enumeration of mirror curves	393
3.2.5	Lunda designs	395
3.2.6	Polyominoes	395
3.2.7	KL s and mirror curves	399
3.2.8	Mirror curves on different surfaces	400
3.2.9	Mirror curves in art	401
3.2.10	KL s and self-avoiding curves	416
3.3	KL s and fullerenes	426
3.3.1	General fullerenes, graphs, symmetry and isomers	427

3.3.2	5/6 fullerenes	428
3.3.3	Knot theory and fullerenes	430
3.3.4	Nanotubes, conical and biconical fullerenes and their symmetry	436
3.3.5	Fullerenes on other surfaces	441
3.4	<i>KLs</i> and logic	443
3.5	Waveforms	449
3.6	Knot automata	453
<i>Bibliography</i>		459
<i>Index</i>		475
