Preface

This book is an introduction to the two-component spinor, or 2-spinor, formalism in general relativity. It has been designed to be readily accessible to those at graduate and research level.

The general mathematical framework of spinors was first introduced by the French mathematician Élie Cartan (1869–1951). Now some ninety years after its conception, spinors are used extensively in the fields of general relativity, quantum mechanics, particle physics, superstrings and M-Theory. Most theoretical physicists are familiar with 4-spinors due to the work of Dirac, and those involved in ten-dimensional superstring theory frequently employ 32-spinors. However, it is primarily through the work of Penrose that the 2-spinor formalism is widely used today in general relativity. Many of the notations and conventions introduced by Penrose are adhered to in this book; particularly those given in Penrose and Rindler, 1984, 1986. Part of the intention here is to equip the reader with the necessary information and techniques to enable him or her to progress to more detailed expositions on the subject, such as the material covered in the aforementioned text and appropriate research articles.

Chapter 1 begins by developing the 2-spinor formalism in a geometrical fashion. This is carried out by associating the real Minkowski coordinates on a Riemann sphere with a single complex one on a complex 2-plane via stereographical projections. A one-to-one correspondence can thereby be established between coordinate systems provided that each single complex ‘point’ is defined in terms of a complex 2-form. The elements of the 2-form will then be seen to form an orthonormal basis in spin-space. Each point in spin space can then be associated with a geometrical object called a spin-vector — the simplest kind of 2-spinor.

In Chapter 2 we build the spinor algebra and construct more general spinors. The connection between spinors and tensors is established through

the use of Infeld–van der Waerden symbols. Furthermore, the decomposition of certain bivalent tensors into their spinor equivalents is discussed. Chapter 2 ends with the algebraic classification of the electromagnetic and Weyl spinors.

Chapter 3 commences with the axiomatic description of the spinor covariant derivative. We go on to introduce the spinor affine connections (Ricci rotation coefficients), curvature spinor and associated spinor fields. This culminates in a discussion of the Newman–Penrose spin coefficient formalism.

The main theme of Chapter 4 is the Lanczos spinor and the Weyl–Lanczos equations. The origins of this spinor are first highlighted together with its significance in general relativity. The Weyl–Lanczos equations are derived (using techniques given in Chapters 2 and 3) and some solutions are obtained.

For the benefit of advanced undergraduates who have done little or no general relativity, but nevertheless wish to gain some knowledge of the 2-spinor formalism, an appendix has been included to review the fundamentals of general relativity.

A number of selected exercises have been given at the end of each chapter.

Finally, I would like to thank Dr. Jennifer Atkinson for creating the index, proofreading and typing the manuscript; Professor Sir Roger Penrose for his support for this work; and Ian Seldrup and Anthony Doyle at World Scientific for their help during the preparation of the manuscript.

Contents

<i>Preface</i>	vii
1. Spinor geometry	1
1.1 Minkowski space	1
1.2 The null cone and Riemann sphere	4
1.3 Spin transformations and spin matrices	7
1.4 Flagpoles and flag planes	8
1.5 Spin-space	10
1.6 Exercises	11
2. Spinor algebra	13
2.1 Abstract index notation	13
2.2 Complex conjugation of spinor components	15
2.3 Vector bases and abstract indices	17
2.4 Levi-Civita spinor	18
2.5 Spinor dyad basis and its components	20
2.6 Spinor symmetry operations	22
2.7 The connection between world-tensors and spinors	24
2.7.1 Infeld-van der Waerden symbols	24
2.7.2 Null vectors	26
2.8 The decomposition of spinors	29
2.8.1 The spinor equivalent of a symmetric valence two tensor	30
2.8.2 The spinor equivalent of the electromagnetic field	
tensor	31
2.9 The canonical decomposition of symmetric spinors	33
2.9.1 Classification of the electromagnetic spinor	34
2.9.2 Classification of the Weyl spinor	34

2.10 Exercises	37
3. Spinor analysis	39
3.1 Spinor form of the covariant derivative	39
3.2 The curvature spinors	41
3.2.1 Symmetries of the curvature spinors	42
3.2.2 The Ricci spinor	44
3.2.3 The Weyl spinor	46
3.3 Spinor equivalent of the Ricci identities	48
3.4 Spinor equivalent of the Bianchi identities	50
3.5 The Newman–Penrose spin coefficient formalism	52
3.5.1 Spin coefficients	52
3.5.2 The Newman–Penrose field equations	58
3.6 Newman–Penrose quantities under Lorentz transformations	64
3.6.1 Null rotation with $\mathbf{l}$ fixed	65
3.6.2 Null rotation with $\mathbf{n}$ fixed	66
3.6.3 Lorentz spin-boost transformation	67
3.7 Miscellaneous transformations	69
3.7.1 $\mathbf{l} \leftrightarrow \mathbf{n}$ and $\mathbf{m} \leftrightarrow -\bar{\mathbf{m}}$	69
3.7.2 Prime operation	71
3.7.3 Asterisk operation	73
3.8 Geroch–Held–Penrose formalism	75
3.8.1 Spin- and boost-weighted scalars	76
3.8.2 Weighted and unweighted spin coefficients	77
3.8.3 Weighted differential operators	80
3.8.4 The Geroch–Held–Penrose field equations	82
3.8.5 A brief note on the modified GHP formalism	86
3.9 Goldberg–Sachs theorem	87
3.10 Exercises	89
4. Lanczos spinor	91
4.1 Introduction	91
4.2 Lanczos’ Lagrangian	92
4.3 Lanczos’ gauge conditions	97
4.4 The Lanczos spinor	100
4.5 The spinor version of the Weyl–Lanczos equations	102
4.6 The Lanczos coefficients	104
4.7 The Weyl–Lanczos equations in spin coefficient form	105
4.8 The Ricci–Lanczos equations in spin coefficient form	106

4.9	The behaviour of Lanczos coefficients under Lorentz transformations	109
4.9.1	Null rotation with $\mathbf{l}$ fixed	109
4.9.2	Null rotation with $\mathbf{n}$ fixed	110
4.9.3	Spin-boost transformation	111
4.10	Miscellaneous transformations	112
4.10.1	$\mathbf{l} \leftrightarrow \mathbf{n}$ and $\mathbf{m} \leftrightarrow -\bar{\mathbf{m}}$	112
4.10.2	Prime operation	112
4.10.3	Asterisk operation	113
4.11	The Weyl–Lanczos equations in GHP form	114
4.12	Solutions of the Weyl–Lanczos equations	114
4.12.1	Petrov type O space-times	115
4.12.2	Petrov type N space-times	116
4.12.3	Petrov type III space-times	116
4.12.4	Lanczos coefficients for the Schwarzschild metric	117
4.13	A brief note on the Lanczos spinor/tensor	120
4.14	Exercises	120

Appendix A Aspects of general relativity 127

A.1	The space-time of general relativity	127
A.1.1	Space-time as a differentiable manifold	127
A.1.2	The tangent space $T_{P_0}(M)$ at a point P_0 of a manifold M	128
A.1.3	Tensor algebra	134
A.1.4	Tensor detection	138
A.1.5	An illustrative example from classical mechanics	140
A.1.6	Tensor fields	142
A.1.7	An illustrative example from special relativity	144
A.2	Riemannian geometry and tensor analysis	146
A.2.1	Introduction	146
A.2.2	Covariant derivatives	151
A.2.3	The curvature tensor	154
A.2.4	The Bianchi identities	157
A.2.5	Riemannian geometry and geodesics	158
A.3	General relativity	161
A.3.1	The field equations	161
A.3.2	The Newtonian approximation	164
A.3.3	The Schwarzschild solution	168
A.3.4	Planetary orbits	170
A.3.5	The deflexion of light	173

A.3.6 The gravitational red shift	175
A.4 Exercises	176
