Foreword

It is a pleasure for me to present to the public this monograph on phase transitions and critical phenomena. In the past few years, along with our improving understanding of these phenomena, their theoretical description has made great progress evolving into more advanced forms. These also include, apart from new approximations elaborated in the framework of the mean-field theory, various novel approaches such as phenomenological and microscopic treatments of fluctuations, the scaling theory and the renormalization group theory. All of them are thoroughly explained in the present book. The author has managed to cover all these topics with a good balance, proceeding from the thermodynamics of phase transitions to the modern theory of the renormalization group. The way of presentation adopted by the author is very instructive. Detailed derivations of almost all the basic equations are included in the monograph. Thus, even readers who are too lazy or too busy to reproduce such calculations themselves can follow easily the discourse to its very end.

Even the introduction of the renormalization group theory does not diminish the importance of the mean-field theory, as we can see, for example, from the recent development of the coherent-anomaly method. Hence, the meticulous explanation of this theory in the present book seems to be justified even from the viewpoint of modern approaches to critical phenomena. Chapter 6 on fluctuations and Chapter 7 on the perturbation theory of fluctuation fields constitute a good introduction to Chapter 8 on the renormalization group theory. The last chapter contains a brief overview of some important applications of the latter method to various problems including the Bose gas, the classical-to-quantum crossover, the random-field problem, the anisotropy effect and multicritical behavior. This part of the book

displays considerable expertise as Dr. Uzunov himself has made a series of interesting contributions in this field.

Masuo Suzuki
Professor of Statistical Physics
University of Tokyo

Preface

This book is intended as an introduction to the theory of phase transitions and critical phenomena. The phase transitions are described by the methods of thermodynamics and statistical physics. On the contrary modern methods for the investigation of outstanding problems in statistical physics, thermodynamics, condensed matter physics and field theory may be partly ascribed to the development of the ideas and theoretical techniques intended to solve the questions of phase transitions. The sophistication of theoretical methods is often an obstacle to the quick understanding of important results currently reported in scientific literature. The main purpose of this book is to present a part of these methods in an intelligible form for students.

The physics of phase transitions is old and abundant in fascinating ideas, theories and experiments. Most of them are substantial for other fields in physics, chemical physics and even for other natural sciences. All the problems concerning phase transitions and even the main part of them cannot be comprised in only one book. I have chosen such a representation of the phase transition theory that goes along a general scheme for the description of phase transitions and critical phenomena. It includes the following topics: the thermodynamic stability theory (Chapter 2) and its connection with the classical and scaling picture of the phase transitions (Chapter 3); the Landau expansion as a further development of the thermodynamic approach and the notion of order and symmetry in condensed matter physics (Chapter 4); an introduction to statistical mechanics and the mean field approximation for homogeneous and inhomogeneous systems (Chapter 5); the fluctuation phenomena and the renormalization group method in treating the fluctuation fields (Chapters 6–8). I have made an attempt to establish a logical relationship between the different theories and their role in the interpretation of experiments. Special attention is paid to the problems which are less illuminated in books and review articles published in the last twenty years. On the contrary, I have only mentioned some important problems like the phenomenological scaling

and the dynamic critical phenomena, for which several excellent books and reviews exist. The text contains a number of references to the literature intended for the reader who is interested in specific problems.

In addition to the presentation of basic ideas, a big part of Chapters 2-8 is devoted to the concrete methods of calculation, characterizing the different theories and approximations. This especially concerns Chapter 7, where the perturbation theory of fluctuations is discussed in detail. I suppose that in this way the renormalization group approach will be more easily comprehended both as a concept and as a technique of calculation.

In Chapters 2-6, I often follow the deductive way of presentation, which to my opinion reveals the wide application of the quasiphenomenological theory to the description of phase transitions.

Chapters 7 and 8 are written in an opposite manner, since when the perturbation theory and diagrammatic technique are understood for simple models, their generalization to more complex cases can be made without difficulties.

Chapters 1 and 9 have in some sense a different role. In Chapter 1 the main stages in the development of theoretical and experimental studies on the phase transitions are outlined accompanied by corresponding references to the literature. The unexperienced reader may find this difficult. In this case I recommend reading it after an acquaintance with the contents of the remaining chapters. Chapter 9 presents the application of the mean field and fluctuation theories to concrete problems. In order to keep this survey within a manageable length it was necessary to avoid, as much as possible, problems which are widely discussed in other reviews. My intention has been to throw light on issues, which are not reviewed in the existing literature. Even within this limited scope it was impossible to present within a single chapter a detailed discussion of all developments; many interesting contributions and details of the technique of calculation are given in the numerous references to original papers. The predominant part of Chapter 9 can be thought as a sum of exercises together with a brief introduction to the problems and a short discussion of the main results. I hope that this part of the book may be interesting also to specialists working in the field of phase transitions.

In the Appendix, I give some mathematical details about the methods for calculation of the functional expansions and perturbation integrals.

This book would not have been completed without the substantial support of Prof. G. Scarpetta and the colleagues from the Department of Theoretical Physics at Salerno University and G. Nadjakov Institute of Solid State Physics of the Bulgarian Academy of Sciences in Sofia. I want to thank my colleagues, the stimulating discussions with them have improved my understanding of the problems of the phase transition theory. They are: Y. Brankov, M. Bushev, K. Chao, L. De Cesare, M. E. Fisher, R. Folk, V. L. Ginzburg, B. I. Halperin, J. A. Hertz, H. Iro, I. D. Lawrie, R. Micnas, L. P. Pitaevskii, V. L. Pokrovskii, D. I. Pushkarov, Kh. Pushkarov, I. Sznajd, N. S. Tonchev, M. Suzuki, and M. Zannetti.

The critical reading of parts of the manuscript by Ms. E. J. Blagoeva, Prof. L. De Cesare, Dr. Y. T. Millev, Dr. C. Noce, Dr. I. Rabuffo, and Dr. A. Romano as well as the technical assistance by Drs. A. Saggese and V. Scarano in the final

preparation of the camera-ready version of the book are gratefully acknowledged.

I am grateful for the hospitality of the Salerno University where this book has been written.

Salerno, January 1992

Contents

Foreword	vii
Preface	ix
Chapter 1 Introduction	1
Chapter 2 Equilibrium States and Phases	18
2.1 Phases	18
2.2 Fundamental relations	19
2.2.1 Fundamental equations	20
2.2.2 Properties	20
2.2.3 Notations	22
2.2.4 Macroscopic scales	23
2.3 Entropy increase	24
2.4 Conditions of equilibrium and stability	26
2.4.1 Equilibrium conditions	27
2.4.2 Stability conditions	29
2.5 Classification of equilibria	34
2.6 Thermodynamic potentials	36
2.6.1 Energy minimum	36
2.6.2 Legendre transformations and extremum conditions	38
2.6.3 Legendre transformations in entropy representation	40
2.6.4 Application	41
2.7 Coexistence of phases	43
2.7.1 Equilibrium conditions	44
2.7.2 Gibbs phase rule	45

2.7.3	Stability conditions	46
2.7.4	Limitation of the thermodynamic theory of stability	49
Chapter 3	Thermodynamic Theory of Phase Transitions	51
3.1	Order parameter	51
3.2	Coexistence of two phases	52
3.2.1	Phase diagram	54
3.2.2	Equilibrium isotherms	55
3.2.3	Relations on the coexistence line	56
3.3	Metastability	58
3.4	Critical point	60
3.5	Classifications of phase transitions	63
3.6	Compressible systems	66
3.6.1	Gas-liquid-solid diagram	66
3.6.2	The solid phase	67
3.6.3	The liquid state	70
3.7	Phase separation in mixtures	73
3.7.1	Binary mixtures	74
3.7.2	Stability conditions and critical states in binary mixtures	76
3.7.3	Coexistence surfaces, critical lines, and second Gibbs rule	77
3.7.4	Tricritical and critical end points. Multicritical phenomena	78
3.8	Other systems	80
3.8.1	General notations	80
3.8.2	Ferromagnets	82
3.8.3	Anisotropy in ferromagnets	86
3.8.4	Complex magnetic order	86
3.8.5	Structural and ferroelectric phase transitions ...	90
3.8.6	Superfluidity and superconductivity	92
3.8.7	Liquid crystals	94
3.9	Advantages and disadvantages of the thermodynamic theory	95
Chapter 4	Landau Expansion	98
4.1	Introductory remarks	98
4.2	Appropriate variables	99
4.3	Generalized Gibbs potential	101
4.3.1	Nonequilibrium potential F^t	101
4.3.2	Nonequilibrium potential Φ	102
4.3.3	Large reservoir and relation between F^t and Φ	105
4.4	Landau potential	106

4.4.1	Taylor expansion	106
4.4.2	Equilibrium	107
4.4.3	Stability	107
4.4.4	Aims of the Landau theory	108
4.4.5	Examples	109
4.5	Phase transition line	110
4.6	Second order phase transitions	111
4.7	First order transitions and the isolated critical point ...	116
4.7.1	Phase diagram of the first order transition ...	116
4.7.2	Metastability. Specific heat	118
4.7.3	The isolated critical point	120
4.8	Extended expansion: φ^6 - and φ^8 -theories	121
4.8.1	First order transition ($u < 0$)	122
4.8.2	The tricritical point ($u = 0$)	126
4.8.3	Irrelevance of the φ^6 -term for $u > 0$	127
4.8.4	φ^8 -theory	127
4.9	Multicomponent order parameter and symmetry breaking	128
4.9.1	Thermodynamic functions	129
4.9.2	Symmetry breaking and symmetry conserving phase transitions. Landau criteria for second order phase transitions	129
4.10	Effect of external field and susceptibility	131
4.10.1	One-component order parameter	131
4.10.2	Two-component order parameter	135
4.11	Miscellaneous topics	137
4.11.1	Notion of crossover phenomena. Critical-to-tricritical crossover	137
4.11.2	Anisotropy	141
4.11.3	Coupling to strains	142
4.11.4	Validity and further development of the Landau theory	143

Chapter 5 Statistical Mechanics and Mean-Field

Approximation	145
5.1 Partition function	145
5.1.1 Microscopic variables	146
5.1.2 Canonical distribution	146
5.1.3 Thermodynamic relations	148
5.2 Fixed external field and order parameter fluctuations ..	149
5.2.1 Continuous variable φ	149
5.2.2 Discrete variable φ	151
5.3 Inhomogeneous systems and translational invariance ...	153
5.4 Coarse-graining and effective Hamiltonian	154
5.4.1 Coarse-graining	154

5.4.2	Transformation of the canonical partition function	155
5.4.3	Quasimacroscopic separability	157
5.4.4	Separability of the Hamiltonian	159
5.4.5	Effective Hamiltonian	160
5.4.6	Remarks	161
5.5	Generating functionals and correlation functions	162
5.6	Ising model	168
5.6.1	Definition of the model	168
5.6.2	Generalization and remarks	169
5.7	Other models	171
5.7.1	Heisenberg and XY model	171
5.7.2	Lattice gas	172
5.7.3	n -component vector models	174
5.7.4	The s -state Potts model	174
5.7.5	The spherical model	174
5.7.6	Biquadratic exchange and single spin energy ..	175
5.8	Mean-field approximation	176
5.8.1	Mean field (MF)	176
5.8.2	Thermodynamic potential	177
5.8.3	Uniform systems and equation of state	179
5.8.4	Expansion of the equation of state and the critical point	181
5.8.5	Helmholtz free energy and generalized potential	182
5.9	Condensation and statistical mechanics	183
5.9.1	On the derivation of the van der Waals equation	183
5.9.2	Corresponding states and universality	185
5.9.3	Critical properties of van der Waals fluids	186

Chapter 6	Fluctuations and Fields	188
6.1	Description of macroscopic fluctuations	188
6.2	Spatially independent fluctuations and anisotropy	190
6.3	Partition function of spatially independent fluctuations	193
6.3.1	Gaussian fluctuations	194
6.3.2	Beyond the Gaussian approximation. Weak coupling	196
6.3.3	Strong coupling and closed-form expression of the partition integral	200
6.4	Fluctuation field	202
6.5	From lattice to field models and vice versa	207
6.5.1	Continuum limit	207

6.5.2	The origin of fields in the generalized thermodynamics	209
6.5.3	Discretization of field models	210
6.5.4	Continuum limit in the momentum space	211
6.5.5	Functional integral	213
6.5.6	Abbreviated series	214
6.6	Integral transformation of microscopic models	215
6.6.1	Transformation of the Ising model and relation to the mean field theory	216
6.6.2	Transformation of other models	223
6.7	Short-range and long-range translationally invariant interactions	227

Chapter 7	Perturbation Theory of Fluctuation Fields	231
7.1	Basic fluctuation Hamiltonian	231
7.2	Free field	234
7.2.1	Equation of state	235
7.2.2	Green function	236
7.3	Thermodynamic properties of free fields	240
7.4	Correlation function of the free fields	244
7.5	Gaussian approximation	250
7.5.1	Goldstone modes	251
7.5.2	Ginzburg–Levanyuk criterion and critical region	252
7.6	Perturbation expansion	254
7.6.1	Perturbation expansion for the partition function and the thermodynamic potential	255
7.6.2	Perturbation expansion for the averages	260
7.7	φ^4 -theory. Coordinate representation	261
7.7.1	First order perturbation contribution to the thermodynamic potential	262
7.7.2	Perturbation contribution to the correlation functions	264
7.7.3	Remarks and calculation of the combinatorial factors	269
7.8	φ^4 -theory. Momentum representation	272
7.8.1	First-order perturbation terms	273
7.8.2	Second-order perturbation terms	275
7.9	Dyson equation and self-energy function	278
7.9.1	Dyson equation	279
7.9.2	Expansion of the self-energy function to order u_0^2	279
7.9.3	Remarks on the reducibility of the diagrams ..	282
7.10	Notion of renormalization	284

7.10.1	Mass renormalization from the perturbation series	285
7.10.2	Mass-renormalization counter-term	286
7.11	Properties of the standard perturbation series	289
7.11.1	How to determine the critical region from the perturbation expansion	289
7.11.2	Effective expansion parameter	292
7.11.3	Dependence on the symmetry index n and the spatial dimension d . Universality classes ...	293
7.11.4	Borderline dimensions	294
7.11.5	Breakdown of the standard perturbation expansion	295

Chapter 8	Renormalization Group	297
8.1	Modified perturbation scheme	297
8.2	Perturbation expansion for the effective Hamiltonian ..	301
8.2.1	First order calculation	302
8.2.2	Vertex functions	304
8.2.3	Second order calculation	305
8.3	Loop expansion	307
8.3.1	One-loop approximation	307
8.3.2	Two-loop approximation	309
8.3.3	Large- b limit and one-component field	311
8.3.4	Remarks on the renormalization	312
8.4	Large- n limit and Hartree approximation	313
8.4.1	Hartree diagrams	313
8.4.2	Large- n critical behaviour	314
8.4.3	Hartree approximation	317
8.5	Renormalization-group (RG) recursion relations	318
8.6	RG in the one-loop approximation	323
8.6.1	General features of the RG equations	323
8.6.2	RG at the critical point	324
8.6.3	Critical Hamiltonian and notion of fixed points (FPs)	328
8.7	Linearized RG in the one-loop approximation	330
8.7.1	Recursion relations and FPs	330
8.7.2	Linearization and exponents	332
8.7.3	RG flow lines and classification of the scaling fields	335
8.7.4	Remarks on the effect of the high-order interaction terms	337
8.7.5	Dimensional analysis	339
8.7.6	Differential RG relations	340
8.8	RG and thermodynamics	341

8.8.1	Scaling form of the thermodynamic potential and classification of the scaling fields	342
8.8.2	Scaling relations	346
8.8.3	Remarks on the crossover phenomena in the critical region	349
8.8.4	Scaling and ϵ -expansion	350
8.9	RG in the two-loop approximation.	351
8.9.1	Recursion relations to order ϵ^2	352

8.9.3	Exponents and stability properties.	356
8.10	Other theoretical schemes and methods of calculation ..	359
8.10.1	Direct calculation of the critical exponents	359
8.10.2	RG in three dimensions	360
8.10.3	$1/n$ -expansion	361
8.10.4	x -space RG and references to other topics	362
8.11	Summary of RG and relations with other theories	362

Chapter 9	Some Applications	366
9.1	Preliminary remarks	366
9.2	Ideal Bose gas	366
9.2.1	Thermodynamics	367
9.2.2	Bose-Einstein condensation at finite temperatures	370
9.2.3	Zero-temperature condensation	370
9.3	Nonideal Bose gas	370
9.3.1	Notion of universality of the critical behaviour at finite critical temperatures	370
9.3.2	Functional formulation	371
9.3.3	RG results	374
9.3.4	Notes	378
9.4	Quantum critical phenomena and classical-to-quantum crossover	378
9.5	Disorder effects	380
9.5.1	Random critical temperature	381
9.5.2	Extended impurities and long-range random correlations	383
9.5.3	Random fields	384
9.5.4	Technical remarks	386
9.5.5	Ginzburg criterion	386
9.6	Anisotropy, coupled order parameters and multicritical behaviour	387
9.6.1	Anisotropic systems	387
9.6.2	Mean-field analysis of anisotropic systems	388
9.6.3	Cubic anisotropy in the mean-field approximation	390

9.6.4	RG studies of anisotropic systems	392
9.6.5	Tricritical points and RG	393
9.6.6	Bicritical and tetracritical points	394
9.6.7	Lifshitz's and tricritical Lifshitz's points	396
9.7	Critical properties of superconductors and liquid crystals	396
9.7.1	Conventional superconductors	397
9.7.2	Unconventional superconductors	399
9.7.3	Layered superconductors	399
9.7.4	Fluctuations	400
9.7.5	Critical properties and the fluctuation induced weakly-first-order transition in superconductors	401
9.7.6	Weakly-first-order smectic A-nematic phase transition	403
