The statements in these papers that the Schwarzschild-like solutions approximate the standard Schwarzschild solution “At macroscopic distances $\gg 10^{-17}\mathcal{M}$ cm outside the nominal horizon” should read “At macroscopic distances $\gg 10^{-17}\mathcal{M}^2$ cm outside the nominal horizon”, where $\mathcal{M}$ is the black hole mass in solar mass units. This is 10^{-17} cm for a solar mass black hole, 10^{-14} cm for a 30 solar mass black hole, and 10^3 cm for a 10^{10} solar mass black hole.
